Harald Gebhard<sup>1</sup>, Rafał Mielniczuk<sup>1,2</sup> (1<mark>Subscription-based and secure GNSS data</mark>

13 March 2012

#### Introduction

#### State of the Art

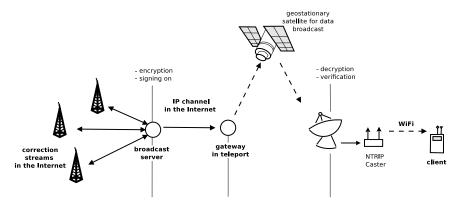

- mobile Internet connectivity
  - NTRIP
  - cheap data transmission
  - requires bidirectional connection(authentication)
  - does not provide data security
  - not available in rural areas
- satellite links:
  - continental signal coverage
  - unidirectional ideal for dissemination to the masses because of cheap reception hardware
  - more expensive than terrestrial links,
    e.g. 512 kbps - 5000 euro per month

Harald Gebhard<sup>1</sup>, Rafał Mielniczuk<sup>1,2</sup> (1<mark>Subscription-based and secure GNSS data</mark>

Introduction

## System for GNSS data dissemination via TV satellite links

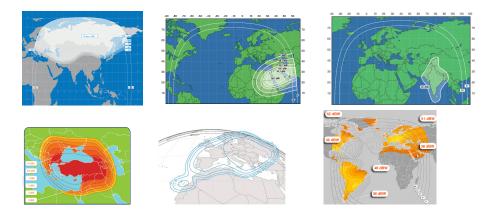

Harald Gebhard<sup>1</sup>, Rafał Mielniczuk $^{1,2}$  (1Subscription-based and secure GNSS data

#### Main system functions

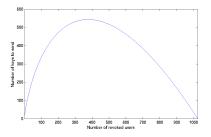

Harald Gebhard<sup>1</sup>, Rafał Mielniczuk<sup>1,2</sup> (1<mark>Subscription-based and secure GNSS data</mark>

13 March 2012 5 / 13

#### Encryption and authentication details

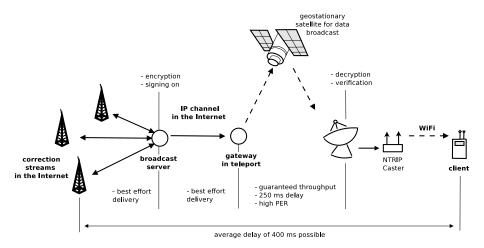

• the Subset Cover framework

- used in Blu-ray and HD-DVD
- makes user revocation possible
- allows for traitor tracing
- sends encrypted keys and encrypted data
- data encrypted with 128bit AES
- streams arranged in bouquets
- usage of Digital Signature Algorithm and Elliptic Curves Cryptography with a key of length 160 bits

Harald Gebhard<sup>1</sup>, Rafał Mielniczuk<sup>1,2</sup> (1<mark>Subscription-based and secure GNSS data</mark>

#### Protocol requirements

Requirements:

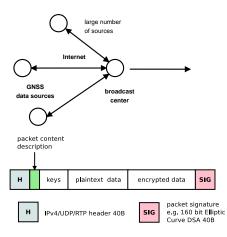

- robustness
- uses IP/UDP stack
- Iow overhead
- supports large number of sources
- provides synchronization between data and encryption keys

Overhead for single socket-single, single-stream approach:

- 16% additional 40B of IP+UDP+RTP headers
- 28% additional 40B of signature

13 March 2012

#### Protocol construction

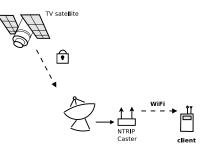

- multiplexes data into cumulative streams
- packets size up to network's MTU
- RTP header used for timing, packets order and sender's identification number encoding
- protocol overhead for the same histogram:
  - 4% (IP+UDP+RTP headers)
  - 6% (with signature)

Harald Gebhard<sup>1</sup>, Rafał Mielniczuk<sup>1,2</sup> (1<mark>Subscription-based and secure GNSS data</mark>

#### Mobile TV Satellite Antennas

- automatic satellite acquisition
- require direct line of sight
- required EIRP > 50dBW
- price from 3000 euro
- can already be installed in luxury vehicles

#### Experimental equipment and setup procedure

#### exemplary hardware

- orbital 1.0m aluminum dish
- 1m high ground stand, detachable
- Alix 1.D PC Engines, miniITX
- SkyStar HD 2 PCI receiver

setup in few steps

- direct the dish to a satellite
- set up the DVB card
- configure an IP stack
- start the client application

Harald Gebhard<sup>1</sup>, Rafał Mielniczuk<sup>1,2</sup> (1<mark>Subscription-based and secure GNSS data</mark>

13 March 2012

#### Project status

- system design
- successful implementation
- data delay and integrity tests
- entire system tested in an environment emulating real IP conditions
  - delay
  - throughput limitation
  - packet losses
  - packet reordering
- development of RTCM SC-104 data format compression techniques
- preparations for field tests with a satellite

13 March 2012

#### The End

## Thank you for your attention!
